

Website Security Test

Can your Website be hacked?

As many as 70% of web sites have vulnerabilities that could lead to the theft of sensitive corporate data such as credit card information and customer lists.

Hackers are concentrating their efforts on web-based applications - shopping carts, forms, login pages, etc.

Accessible 24/7 from anywhere in the world, insecure web applications provide easy access to backend databases and also allow hackers to perform illegal activities using the attacked site.

A victim's website can be used to launch criminal activities or to transfer illicit content, while abusing the website's bandwidth and making you the website's owner liable for these unlawful acts.

Don't firewalls protect me?

Firewalls are futile. Web application attacks go straight through the firewall, past operating system and network level security, and right in to the heart of your application and corporate data.

Tailor-made web applications are often insufficiently tested, have undiscovered vulnerabilities and are therefore easy prey for hackers.

Find out if your web site is secure before hackers download sensitive data, commit a crime using your web site as a launch pad, and endanger your business.

What are you offering?

Our **Website Security Test** service involves testing, analysing and reporting on the security status of your website. The service may be called many different names such as "pen test", "penetration test", "vulnerability assessment" and so on.

The objective is common, is to find out what risks or security holes are present on the website which may impact your business.

Website Security Test

Why do I need it?

Simple – every organisation needs to ensure their website and the information held and published online is safe and secure. By regularly checking the security of your website it will ensure you are taking the first steps to:

- Protecting your organisation from financial loss through fraud attacks (hackers, disgruntled employees, your competitors and so on)
- Ensuring your website is available, protected and safe as the first port of call for your existing and perspective clients
- Protecting your brand by avoiding and loss of confidence for incorrect or abused websites

What will I get?

By using a combination of advanced security testing tools and manual testing techniques, our qualified experts will test your entire website for known vulnerabilities and flaws.

You will receive an independent evaluation of the website detailing all risks found and also any potential risks observed.

The comprehensive report will outline each individual risk, the associated impact of the threat and advice on how to deal with the issue.

How much does it cost?

1 X Single Website Security Test: Please Call

4 X Quarterly Testing of Website: Please Call

Can you afford to be hacked?
